

Already in a degree, or a career? Here's how to protect its value.

If your kid is already in the degree — or already out and looking — you didn't miss the window. You're standing at a different one.

The planning question was *which field*. That decision is behind you, and there's no use relitigating a bet you've already placed. But the bet was never really the field. It was the lane inside it — and the lane is still wide open.

Every field we score holds a protected career and an exposed one under the same job title. Nobody assigns your kid to one or the other. They steer there — through what they specialize in, the experience they stack, the first jobs they take, the tools they learn to wield. Someone already in has fewer choices left than a planner. But the ones they have left are the ones that actually decide it.

SIX MOVES, ALL POINTING THE SAME DIRECTION

1 Protect the value they're already building.

Point every choice toward the work AI can't hold: judgment someone has to trust, a decision someone has to pin on a *human*, work that happens in the room and in the unpredictable moment. On a résumé, the line AI can't reproduce is the only line that's appreciating. So when there's a choice between the clean, repeatable project and the messy one that forces real judgment — take the messy one. The clean one is the one being automated.

2 Buy flexibility — don't specialize into a corner.

Under pressure the instinct is to niche down hard to land the first job. Be careful *which* niche. A niche that's a deep human skill is a moat. A niche that's a screen-reducible task is a trap that's expensive to climb out of. Build the barbell: one genuinely hard human capability, plus real fluency with the tools. Skills that travel across lanes beat skills that only work in one.

3 Get the AI-native edge — be the operator, not the operated-on.

In every field the split is coming down to who *wields* the tools versus who competes with them. Your kid doesn't need to become an engineer. They need to be the obvious person in their field who's faster and sharper because they use AI well — the one supervising the machine's output with expert judgment. That person doesn't get automated; they get leverage. Start now, before anyone requires it.

4 Steer toward the protected adjacent track.

This is where the scores earn their keep. Their field has a safe lane — usually the licensed, in-person, senior-judgment, novel-stakes corner — and from where they stand there's a bridge to it. Accounting: from bookkeeping toward the CPA signature. Law: from document review toward the courtroom. Computer science: from the entry rung toward senior judgment and systems. The move isn't dramatic. It's a series of small choices all pointed the same way.

The profile for your specific field names the likely exposed lane, the safe lane to aim at, and the exact bridge between them.

5 Know when the safe track is one field over.

Sometimes the honest answer is that the safe lane in their field is narrow — and the adjacent safe work sits one field to the side, reachable because their credential or skills transfer. That isn't failure or starting over. It's using what they've already built as a bridge. Look for the neighboring field where their training is an asset *and* the work is more human-accountable.

6 Bank the relationships — the one asset AI can't reach.

AI can do the task, but it can't be *trusted*. It has no reputation, it can't be mentored, nobody refers it. The most protected career capital your kid can build isn't a skill at all — it's the set of people who know their work and would vouch for it. Mentors who open doors. Practitioners who tell them where the field is really heading. A reputation that walks into the room ahead of them. As the tasks get cheaper, the person people *choose* to work with gets more valuable, not less. This isn't schmoozing — it's the moat.

What to do right now

Six moves are the strategy. Here's where anyone can start today — in the degree or already out.

- ☐ **Pull up five job ads for senior roles in the field** — the protected kind, not entry. Write down what they actually ask for. That list is the safe lane's requirements, and it's the target.
- ☐ **Find the one requirement you can start on now.** You don't need fifteen years — you need the first credible unit of it. What's the smallest real version you could have on the record inside six months?
- ☐ **Ask a professor the specific question:** *where is the hands-on, human-accountable part of this field, and how do I get reps in it while I'm here?* Not “what should I do” — the pointed version.
- ☐ **Talk to one practitioner five to ten years ahead.** Ask where they think the safe work is going, and what they'd do at your stage now. Fifteen minutes — most people say yes.
- ☐ **Learn one AI tool the field actually uses** — well enough to *show* it, not just name it.
- ☐ **Bank one un-automatable experience now** — the project, rotation, client or shift that forces real judgment, over the clean repeatable one.

You're not behind. You're in the part of the story where the choices get smaller — and count for more. Point them all the same way, and the value compounds.
