

Is a Journalism Degree Worth It in the AI Era?

The already-in-it guide — the full scores by track, the six factors behind them, and what to do from where you already are.

8.3

AI EXPOSURE · DESK / AGGREGATION & REWRITE
where 10 is most at risk

For anyone already in it — in the degree, or job-hunting.

Before you read this

The choice is already made — you're in a journalism degree or training, or out of one and into the job hunt. So this guide skips the "should you study journalism" question and goes straight to the one that's actually live: given where you already are, what do you do about it?

It's written to you directly — whether you are the one in it, or a parent reading on their behalf. Where it says "you," a parent can simply read "them"; the moves are the same either way.

What this is. A facts document, not a pep talk. We have not softened the numbers, because a document that did would be doing you no favours. But we've also not written it as a case against journalism, because the skills are genuinely valuable, the work matters, and there are places that are hiring. The honest advice is narrow rather than negative — and from where you already stand, narrow is useful.

The good news, up front — and the honest version of it. Already in it is not too late.

Journalism isn't one destination, it's a wide spread of them, from 5.1 to 8.3, and where you land inside that range is decided mostly by moves still in front of you — chiefly whether you aim at original reporting and can show evidence of doing it. What you can't steer is the industry's economics, and this guide won't pretend otherwise. But which version of the work you point at, and what you can prove you've done, is genuinely still open.

And one thing specific to journalism. This is the hardest guide in the index, and most of what makes it hard has nothing to do with AI. The industry has been contracting for twenty-five years for economic reasons, and our framework can't see any of it. Whatever the headline number says, the economics matter more — which is exactly why steering deliberately from here is the whole game.

The short answer

Not as a route to a newsroom desk job — that path is close to closed, and mostly for reasons that predate AI by two decades.

Desk journalism — aggregation, rewriting, routine news production — scores **8.3** out of 10. Investigative reporting scores **5.1**.

But journalism is the profession where our score is least useful on its own, and we'd rather say that plainly than let a number do work it hasn't earned. The industry's problem is economic. AI is the accelerant, not the cause. Between the protected end and the exposed one, where you land is decided mostly by moves still in front of you — which is the whole reason being already in it is not a lost cause.

The scores

TRACK	2023	2025	FALL 2026	3-YR MOVEMENT	BAND
Investigative reporting	4.5	4.8	5.1	+0.6	Moderate
Specialist / trade reporting	5.2	5.5	5.8	+0.6	Moderate
Data journalism	5.7	6.1	6.5	+0.8	Moderate-High
General news reporting	6.0	6.4	6.7	+0.7	Moderate-High
Desk / aggregation & rewrite	7.0	7.8	8.3	+1.3	High

Scores run 1–10, where 10 is most at risk. For context: the median profession in this edition sits around 5.5, graphic design production scores 8.4, and entry-level software development 8.1.

Note where this starts. Desk journalism was already at 7.0 in 2023 — the highest 2023 score of any track in this index. Its problem substantially predates the current wave. Your job, from here, is to move toward the protected end — investigative (5.1) and specialist reporting (5.8) — not to drift into the desk work at 8.3 that is both the easiest to be offered and the fastest disappearing.

Read the score carefully — this is the important section

We'd normally save the market context for later. In journalism it belongs before anything else, because the number on its own is misleading.

Our index measures automation exposure. It does not measure industry health. In most professions those track together closely enough that the distinction is academic. In journalism they have come apart completely.

The scale of what happened, and none of it was AI:

- Employment in American publishing has fallen roughly **40% since the late 1990s** — from around 91,000 jobs to about 55,000
- BLS figures put reporters, correspondents and broadcast news analysts at roughly 45,000–50,000 today, down from a peak near 114,000 in 2008 — close to a 60% decline
- Pew Research found newsroom employment at newspapers fell **by more than half between 2008 and 2020**
- Around **2,900 newspapers have closed** in the US since 2005, leaving over 200 counties with no local news outlet at all
- BLS projects editor roles growing about **1% annually** — a rounding error from an industry-wide hiring freeze

What caused it: classified revenue moving to the platforms, advertising moving to search and social, and audiences fragmenting. That process ran its course before generative AI existed.

So what is AI actually doing here? It is removing the shock absorber. Desk work — rewriting wire copy, aggregating other outlets, producing routine reports — was the role that survived earlier rounds precisely because someone had to do it. That is the part now automating, which takes the remaining cushion out of an industry that had already used up its slack.

And there's a quality dimension worth naming. AI adoption is heaviest in exactly the places least equipped to check it — resource-strapped local newsrooms experimenting with AI-drafted copy are also the ones without robust fact-checking capacity.

Weigh the industry's finances first and our score second. We'd rather say that than claim more for our own factor than it deserves.

The number that should decide this

One comparison matters more than any other in this guide.

Roughly 95,000 students are enrolled in journalism and mass communication programs in the United States, according to the University of Georgia's annual enrollment survey — a figure that has ticked slightly upward.

The total working population of reporters, correspondents and broadcast news analysts is around 45,000–50,000.

That is roughly two students in the pipeline for every working journalist in the country.

This is not a statement about talent or effort. It's arithmetic. And it explains something the AI conversation cannot: why journalism graduates struggle even in years when the industry isn't cutting.

The practical consequence: journalism is a field where the *degree* is abundant and the *evidence of doing it* is scarce. Which shapes all of the advice below — and, if you're already in the degree, tells you exactly where to spend the time you have left.

Why journalism scores the way it does — the six factors

Here's how desk and aggregation work answers them.

HOW MUCH OF THIS JOB CAN AI ALREADY DO? (35% OF THE SCORE)

Nearly all of it.

Rewriting wire copy. Aggregating other outlets' coverage. Summarising reports and filings. Routine sports and earnings write-ups. Headline and SEO optimization. Transcription and first-pass editing.

What resists: being in the room, cultivating a source who trusts you, obtaining a document nobody published, standing behind a claim legally, and knowing when someone is lying to you. Those are the things to be building toward.

HOW HARD WILL IT BE TO LAND THAT FIRST JOB? (15%)

The worst of any career in this index, and it was broken before AI arrived.

The section on the broken entry path, below, covers why. The short version: the traditional apprenticeship — local paper, desk shifts, learning the craft on small stories — thinned dramatically for economic reasons, and what remained of it is now automating.

The way through is unusual, because the arithmetic runs against you. With two students in the pipeline for every working journalist, the degree is not the differentiator — evidence of doing the work is. So the way in isn't to wait for a graduate desk job that may not exist; it's to arrive already publishing, already holding a beat, and aimed at the protected end (investigative 5.1, specialist and trade 5.8) rather than the desk (8.3) that is both the easiest to be offered and the fastest disappearing. Repositioning and the career-hunting checklist below turn that into concrete moves.

DOES IT HAVE TO BE DONE IN PERSON, WITH YOUR HANDS? (15%)

For real reporting, more than people assume. Being physically present at a council meeting, a court, a scene, or a source's kitchen table is not replicable. For desk work, none of it.

DOES SOMEONE NEED A HUMAN THEY CAN TRUST AND HOLD RESPONSIBLE? (15%)

At the investigative end substantially; at the desk end not at all.

A source risking their job talks to a person, not an outlet. And someone must be legally answerable for what is published. Which means the fastest way to become protected is to get closer to the reporting someone has to stand behind.

DOES THE LAW REQUIRE A LICENSED HUMAN? (10%)

No. Journalism has no license and — for good reasons of press freedom — should not.

HOW OFTEN DOES THE JOB HIT GENUINELY NEW, HIGH-STAKES SITUATIONS? (10%)

At the investigative end constantly; at the desk end rarely. The distance between those two is the distance you're trying to close.

The entry path — broken early, and for different reasons

This is where journalism differs most instructively from every other career in this index.

Everywhere else, entry-path erosion is a recent story. AI absorbs the junior tasks, the on-ramp narrows over three or four years, and the profession is left healthy at the top and thin at the bottom.

Journalism's on-ramp had already thinned two decades ago. Local titles closed. Regional newsrooms consolidated. The entry-level reporting jobs disappeared with the revenue that funded them.

So when we rate journalism 8.5 on this factor, most of that rating is not about automation at all. It's about an industry that spent twenty years removing the rungs for economic reasons, and has now automated what was left of them.

Why this matters for how you read the score. In nursing, an entry-path rating of 2.0 tells you something durable — clinical hours are mandated by law and won't disappear. In journalism, the 8.5 reflects several forces, only one of which our framework measures, and the non-AI part is both larger and less likely to reverse.

The general lesson: when a factor rates badly, ask what's actually driving it. Automation-driven erosion might reverse if firms rediscover the value of training juniors. Economics-driven erosion does not reverse unless the money comes back.

What the trend shows

Desk journalism: 7.0 → 7.8 → 8.3. Up 1.3.

Investigative reporting: 4.5 → 4.8 → 5.1. Up 0.6.

The gap widened from 2.5 points to 3.2. The pattern is the same as everywhere in this index — original work holds, processing work doesn't. What is different is that journalism started the period with the highest desk score we measured, and the cuts have continued regardless.

Press Gazette's tracker logged at least **3,434 journalism job cuts across the US and UK in 2025**, with 2026 running at a pace that may exceed it — including at the Washington Post, Politico, Vox Media, Axios, CNBC, CBS News and the Wall Street Journal by early spring.

How durable is the protection?

PROTECTION	STRENGTH TODAY	DURABILITY	WHERE THE PRESSURE IS COMING FROM
Judgment under novelty	Strong in investigation	Durable	Original reporting on unprecedented events resists automation entirely.
Human trust / accountability	Strong at the reporting end	Durable	Sources trust people, not outlets. Legal liability attaches to a named human.
Physical / embodied	Real for original reporting	Durable	Being in the room cannot be simulated.
Regulatory / licensing	None	n/a	And shouldn't exist — press freedom depends on it.

The honest read. Journalism's protections are genuine and they are all attached to original reporting. The problem is not that the protected work is unprotected. It's that there is far less of it being paid for than there used to be — which is why the direction you steer matters more than where you happen to start.

Where the work actually went

This is the constructive half, and it's more substantial than the headlines suggest.

Digital-native and subscription outlets have added an estimated 15,000-plus positions since 2020. The economics that work now are subscription and membership rather than display advertising — which changes who is hiring and what they want.

Newsletter and independent journalism is now a serious segment: over 35,000 active journalist-run publications on platforms like Substack and Beehiiv, and legacy outlets including the Financial Times launching on those platforms to reach new audiences.

Nonprofit newsrooms — ProPublica, The Marshall Project, Inside Climate News, and a growing set of state and local nonprofits — have continued hiring through the cutting cycle. The roles are competitive, pay below private-sector peers, and cannot come close to absorbing the number of journalists being laid off. They are real jobs and they are not a solution.

Trade and specialist publications are smaller but viable, and consistently short of people who genuinely understand a technical field.

Public media has been relatively stable at around 15,000 full-time positions, though funding debates introduce real uncertainty.

And the largest destination of all is adjacent rather than inside. The PR-to-journalist ratio has widened to roughly **six to one**. Communications, content and brand journalism absorb far more journalism graduates than newsrooms do — which is worth knowing as you decide where to aim from here.

Human strengths that will matter most

1. **Getting people to tell you things** — source cultivation, and the single least automatable skill in this profession. 2. **Being physically present** — at the meeting, the court, the scene. 3. **Verification** — knowing what's true, which is a scarcer skill as unverified content volume rises. 4. **Legal and ethical judgment** — knowing what can be published, and standing behind it. 5. **Knowing when someone is lying to you** — the thing no system does.

Notably absent: writing speed, volume of output, and headline optimization. These were the traditional markers of a strong junior and are entirely automated. If your current value is mostly on that second list, the work is to shift it onto the first.

And underneath all five, two traits the score can't grade: **curiosity and adaptability**. The specific tools — the transcription engine, the document-search system, the verification platform — will turn over many times across a career. The journalists who compound are the ones who stay genuinely curious about a subject and a beat and re-tool fastest, rather than defending the one way of working they trained on. In a field where the processing work is automating fastest, that flexibility is itself a form of protection — and increasingly it's what the outlets that are still hiring look for: the reporter who can find things out and adapt, not the one who can only produce copy.

Other things to consider about this job

What's genuinely good about it

The work itself, when you get to do it, is among the most meaningful available. Holding power to account, finding out what actually happened, telling someone's story properly — people who do this describe it in terms closer to vocation than employment, and the ones who leave almost always miss it.

The skills travel exceptionally well. Verification, interviewing, working a beat, writing clearly under pressure, and explaining complexity are genuinely valuable and increasingly scarce — in policy, research, communications, investigation, law and consultancy.

Independent publishing is a genuine route in a way it wasn't a decade ago. Some of the best-known journalists in the country now run their own publications with six-figure subscriber bases. It is difficult and it is real.

And specialization is rewarded. Freelance income has become harder for general-interest writing and *easier* for vertical specialists — one of the clearest signals in this guide about where to point.

What's genuinely hard about it

Pay is low relative to the education required, and it has been for a long time.

Precarity is structural. Average tenure at a single outlet has fallen to around 3.2 years, from 5.1 in 2012, and roughly 12% of working journalists hold a second job.

There is no ladder. One industry analyst put it starkly: there is no ladder left to climb, only avoiding falling off. That's a harsh framing and it isn't inaccurate for the general-interest end — which is the argument for pointing yourself at the specialist and investigative end instead.

Building a freelance practice takes time. Industry estimates put it at 12–18 months to replace a staff salary, which is a real financial requirement most graduates don't have.

Who this work suits — and who it doesn't

Journalism tends to suit people who:

- **Get people to talk to them.** The core skill, largely untrainable, and instantly recognizable in people who have it.
- **Are genuinely curious about other people's lives** rather than about writing
- **Are comfortable being unwelcome** — much of real reporting is asking people things they'd rather not answer
- **Are stubborn** — most stories are refusals until they aren't
- **Can accept insecurity** as a permanent condition rather than an early-career phase

It's harder for people who:

- Want to **write** more than they want to **find things out**. This is the most common mistake, and it's the difference between journalism and content work.
- Need **financial stability** early
- Find **rejection and conflict** draining
- Are drawn to the **idea** of journalism from film and television rather than the daily reality

If some of that second list sounds like you, it isn't automatically a reason to abandon the path — but it is a reason to be honest about whether you're aiming at reporting or at content work, because they are not the same career.

What else is moving this market

Everything in the market-context section above, plus one thing worth adding: **search referral traffic has collapsed for many publishers** as AI-generated answers replace clicks. That is a direct technology-driven revenue hit on top of the older advertising collapse, and it is currently getting worse rather than better.

The AI-native advantage — what it actually looks like

Journalism is the profession where AI creates the most demand for the thing it can't do — and being already in it, close to real reporting, is where you build that. A current beat, a student masthead, a first job: all of it is somewhere to practise pointing at what the tools can't do.

WHAT AN AI-NATIVE JOURNALIST LOOKS LIKE

- 1. Verify at scale.** As unverified content volume rises, the ability to establish what is actually true becomes more valuable, not less. This is journalism's central skill and it is appreciating.
- 2. Use the tools for the grunt work.** Transcription, document search, data extraction, first-pass research. Investigative work involves enormous volumes of material, and these tools genuinely help.
- 3. Investigate AI itself.** Algorithmic accountability, AI in public services, automated decision-making — a beat that barely existed five years ago and is badly under-covered.
- 4. Understand the failure modes.** Newsrooms are publishing AI-assisted copy, often without adequate checking. Someone who knows where these systems fabricate is immediately useful.
- 5. Build a direct audience.** The economics that work now are subscription and membership. A journalist with their own readership has something no employer can take away.

All five are available to you now — inside a current course, a beat, a first job — not after some future qualification. Turning them into concrete moves is the rest of this guide.

Where a journalism degree can take you later

The skills genuinely transfer, and this is the honest strength of the qualification even where the career doesn't work out: communications and public affairs, policy research, investigation and compliance, documentary and audio production, publishing, law (verification and argument transfer well), and independent publishing.

Two notes. Communications and PR absorb the largest share, and the ratio is roughly six PR professionals to every journalist. And content-production roles built on volume score like marketing execution at 8.2, not like journalism. They look adjacent and they aren't — which is the compass for every choice below.

Repositioning from here

The program-selection stage is behind you. The useful questions now are different — and the honest good news bears repeating: where you land inside the field is decided mostly by moves still in front of you. Journalism is a spread from 5.1 to 8.3, and while you can't steer the industry's economics, you can steer which version of the work you point at and what you can prove you've done. Nearly all of it points the same way: toward original reporting, and toward evidence.

If you're still in the degree or training

Three levers, in order of leverage.

- 1. Evidence is the whole game.** In a field with two students for every working journalist, the degree is not the differentiator — a real byline is. Whatever time you have left in the program, spend it publishing: student media, local outlets, freelance. Arriving in the job market already holding a body of published work is the single thing that separates you from the funnel behind you.
- 2. A beat, while it's still cheap to build.** The exposed end is the generalist desk (8.3) and general news (6.7); the protected end is specialist and trade reporting (5.8) and investigation (5.1), and freelance income is getting easier for vertical specialists and harder for general-interest writing. Choose a subject — health, climate, courts, local government, technology — and become

genuinely expert in it while you still have the time to. If you haven't committed to one, this is the highest-leverage decision left in the degree.

3. The durable skills, taught properly. Verification, public records and media law are the ones appreciating as unverified content volume rises — not writing speed or headline optimization, which are automated. Take them seriously now: they are what the outlets still hiring are hiring for, and far cheaper to learn in the program than to bolt on later.

If you've graduated and you're job-hunting

Here the title on the offer matters more than it looks, because the most available early-career titles are also the most exposed.

- **Desk, aggregation and content-production roles are the 8.3.** They're the most common early destinations and the automating layer at once — and content production built on volume scores 8.2, like marketing execution, not like journalism. Taking one isn't fatal, but take it as a deliberate stepping-stone with an exit in mind, not as the plan.
- **Aim at the protected lanes (5.1, 5.8).** Investigative, specialist and trade reporting — closer to original work, better protected, and consistently short of people who genuinely understand a field.
- **Follow the money that works.** Digital-native and subscription outlets have added 15,000-plus roles since 2020; nonprofit and public media are hiring through the cutting cycle. Display-advertising and search-referral models are the ones the revenue collapse is still hitting.
- **Lead with the beat and the bylines.** The evidence of doing the work is the credential here; the qualification is not. And know going in that communications absorbs most graduates at roughly six to one — an acceptable destination for some, but decide that on purpose.

The AI-native move, from where you stand

You can't change the industry's economics, but you can be the journalist who directs these tools rather than competes with the copy they now produce. The most powerful move for someone already in it is verification at scale: be the person who can establish what is actually true when unverified content volume is rising — the one skill in this profession that is appreciating rather than depreciating. Pair it with a beat that investigates AI itself, a badly under-covered subject, and a direct audience of your own, and you have something no employer can take away — and it's a body of work you can start building this term, not after some future qualification.

The career-hunting checklist

The analysis tells you where the exposure is. This is what to do about it — the part that's actually in your hands. Most of the protection in journalism is built here, in these habits and choices, rather than handed to you. The first list is for anyone still in the degree or training; the second is for the job hunt itself.

During the degree — build evidence of doing the work

- **Publish from year one, relentlessly.** In a field with two students per working journalist, the degree is not the differentiator — a real byline is. Student media, local outlets, freelance: get the evidence that everyone else in the pipeline lacks.
- **Choose a beat and become genuinely expert in it.** Health, climate, courts, local government, technology. Specialists are hiring; generalists are not, and freelance income is getting easier for vertical specialists and harder for general-interest writing.
- **Aim at the protected end on purpose.** Investigative (5.1) and specialist/trade (5.8) reporting are where the protection lives. Desk and aggregation (8.3) and general news (6.7) are the exposed lane, however available they are.
- **Learn verification, public records and media law properly.** These are the durable skills — the ones appreciating as unverified content volume rises — not writing speed or headline optimization, which are automated.
- **Build a direct audience while it's cheap to start.** A newsletter or specialist publication is a readership no employer can take away, and the economics that work now are subscription and membership.
- **Feed curiosity and adaptability on purpose.** The tools will turn over repeatedly; the reporter who re-tools fastest, and stays genuinely curious about a beat, compounds.
- **Keep the frame wide — and honest.** Communications, policy research and investigation absorb most graduates. Vet them properly, and decide whether they're acceptable before you finish, not after.

During the job hunt — aim, don't just apply

- **Target the protected lanes on purpose.** Investigative, specialist and trade reporting (5.1, 5.8), digital-native and subscription outlets, nonprofit and public media — not "any newsroom role," which too often points at the desk.
- **Read the title, not just the offer.** Desk, aggregation and content-production roles are the automating layer — content production built on volume scores 8.2, like marketing

execution, not like journalism. If you take one, take it as a deliberate stepping-stone with an exit in mind, not as the plan.

- **Don't grab a job just because it's on offer in an exposed lane.** A role being available doesn't make it safe. An outlet still running a large desk or aggregation operation may simply be behind the curve — and that's exactly the rung that gets cut first once it catches up. Availability can be a lagging indicator, not a green light.
- **Lead with the beat and the bylines, not the degree.** The evidence of doing the work is the credential here; the qualification is not.
- **Weigh where the outlet's money comes from.** Subscription and membership outlets are hiring for something durable; display-advertising and search-referral models are the ones the revenue collapse is still hitting.
- **Weigh the trajectory over the starting salary.** A lower-paid seat at a subscription outlet, a nonprofit, or a specialist title that lets you do original reporting beats a better-paid desk seat in a lane being automated underneath you.

Go deeper — further reading

- **Journalism job cuts in 2026: the running tracker** — Press Gazette. An updated, sourced log of every announced cut. Uncomfortable reading and the most current picture available. Worth an hour to know the market you're entering.
- **Employment opportunities in journalism: where the jobs are right now** — Mediabistro. The source of the 91,000-to-55,000 publishing employment figure, and a clear-eyed account of which sectors are actually hiring. Read it for the migration story rather than the gloom.
- **Journalism jobs 2026: where to find work and get hired** — on newsletters, nonprofits and brand journalism absorbing roles under different titles. The most useful practical guide to where the work moved.

The counterargument — read this one:

There is a real case that our score is measuring the wrong thing entirely, and it cuts both ways.

The optimistic version: journalism as a *practice* is not declining at all. Digital-native outlets added 15,000-plus roles since 2020. Newsletter journalism is a \$2 billion segment with 35,000-plus active publications. Freelancers now account for 30–35% of bylined

content in major US publications. On this reading, the work migrated and our score is measuring the decline of one business model rather than of a profession.

The pessimistic version: our 8.3 is too low, because it only measures automation. If we scored industry health, desk journalism would be near the top of this index and would have been for a decade.

Where we land: we think the optimistic version is partly right about the work and wrong about the arithmetic. Fifteen thousand new digital roles against a loss of 60,000-plus is a migration, not a replacement — and 95,000 students are entering the funnel behind it. So we hold the score, and we say plainly that you should weigh the industry's economics more heavily than our number. This is the one guide where our framework is least sufficient, and pretending otherwise would be the most misleading thing we could do.

Bottom line

As preparation for a newsroom desk job, a journalism degree is a poor bet — and honest programs say so. But being already in it is not a lost cause, because the decisive moves were always going to happen from here.

The industry has contracted by roughly 60% since 2008 for reasons that have nothing to do with AI. Around 2,900 newspapers have closed. Two students are enrolled for every working journalist. **And AI is now removing the desk work that was the last remaining cushion.**

As a skill set, it holds up much better than the headline suggests. Verification, sourcing, interviewing, working a beat and writing clearly under pressure are genuinely valuable and increasingly scarce — and they travel into policy, research, investigation, communications and law.

And the protected end of journalism is real. Investigative work at 5.1 and specialist reporting at 5.8 are protected by the things that always protected them: being in the room, being trusted by sources, and being answerable for what you publish. There is simply less of it being paid for — so aim at it deliberately rather than assuming you'll land there.

So the useful advice isn't a verdict on the degree — it's a direction. Publish relentlessly, because evidence of doing the work is the credential. Choose a beat and become genuinely expert in something. Point at investigative, specialist or trade work rather than general news or the desk. Follow the money that works — subscription, membership, nonprofit — and understand that communications absorbs most graduates, so decide on purpose whether that's acceptable.

And one honest thing worth saying. Journalism is one of very few careers where the work itself — finding out what actually happened and telling people — is straightforwardly worth doing. That's why people keep entering a contracting industry, and it isn't irrational. But from where you stand now, it has to be steered with the numbers in front of you, not despite them.

Questions worth sitting with

Whether you're the one in it or a parent thinking it through, these are the conversations that move the needle now. Read "you" as whoever the decision is about.

Where you actually stand

1. Which track are you on — or aiming at — and does it point at original reporting (investigative 5.1, specialist 5.8) or at the desk and aggregation work at 8.3? 2. Do you want to write, or do you want to find things out? It's the most important question in this guide, and the answers lead to completely different careers. 3. Can you point to a real body of published work — bylines in real outlets — or only to the degree? If it's the latter, what's the nearest way to change that?

The move from here

4. What's the single most protected role you could realistically aim for from where you are now, and what would make you a credible candidate for it? 5. If you're still studying: have you committed to a beat, and are you publishing relentlessly with the time you have left? 6. If you're job-hunting: are you aiming at the protected lanes and the outlets whose money model works, or applying to whatever's open? Name the three roles you're actually chasing.

The AI question, practically

7. Of the five capabilities — verify at scale, use the tools for grunt work, investigate AI itself, understand the failure modes, build a direct audience — which one could you visibly demonstrate within the next few months? 8. As unverified content volume rises, verification becomes more valuable, and algorithmic accountability is a badly under-covered beat. Can you point to a piece of work that shows either? If not, where's the easiest place to start?

Testing it against reality

9. The most valuable single action, and it's available today: start publishing, or publish more — a newsletter, a local beat, a specialist blog. Nothing else demonstrates whether you'll actually do this. **10.** If the first offer that comes is a desk, aggregation or content-production role, what's your plan — take it as a deliberate stepping-stone with an exit in mind, or hold out for something closer to original reporting? Decide before the offer, not after.

This is analysis and informed judgment about a fast-moving situation. For journalism specifically, we've flagged that our framework measures automation exposure and cannot see industry economics — and that for this profession the economics matter considerably more.

Scores for 2023 and 2025 are retrospectively calculated using the current methodology. Scores measure exposure to what AI can already do — not how much any particular employer has deployed.

Technical scoring appendix — Journalism & Media

Pivotum Degree Risk Index — Fall 2026 Edition

This appendix is the audit trail. It sets out the formula, the rating anchors, every factor rating behind every track score in this profile, the backcast arithmetic, a sensitivity analysis, and the specific things that would change our mind.

We publish it because a score nobody can check is an opinion with a decimal point.

1. The formula

$$\begin{aligned} \text{Risk} = & 0.35 \times \text{Automatability} \\ & + 0.15 \times \text{EntryErosion} \\ & + 0.15 \times (10 - \text{Physical}) \\ & + 0.15 \times (10 - \text{Trust}) \\ & + 0.10 \times (10 - \text{Regulatory}) \\ & + 0.10 \times (10 - \text{Judgment}) \end{aligned}$$

Two exposure factors carry 50% of the weight; three protection factors carry 40%; judgment under novelty carries the remaining 10% and sits on the protection side. The deliberate consequence is that protection can outweigh exposure — which is why a highly automatable job like teaching still scores low.

Bands. Very low below 3.0 · Low 3.0–4.4 · Moderate 4.5–5.4 · Moderate–High 5.5–6.9 · High 7.0 and above.

2. Rating anchors

HOW THE 0–10 RAW RATINGS ARE ANCHORED

Every factor is rated on its own 0–10 scale before weighting. The anchors are identical across all twenty-eight careers, which is what makes the scores comparable.

Task automatability (A) — what share of the working week could a capable current system already do to an acceptable standard?

RATING	ANCHOR
--------	--------

- | | |
|------|---|
| 0–2 | Almost nothing. The work is physical, relational or wholly novel. |
| 3–4 | Administrative surround only — notes, scheduling, correspondence. |
| 5–6 | A meaningful minority of the week, mostly documentation and lookup. |
| 7–8 | A large share, including tasks central to the junior version of the role. |
| 9–10 | Most of the described duties, at or near professional standard. |

Entry-path erosion (E) — *how much has the traditional route into this work narrowed?*

RATING	ANCHOR
--------	--------

- | | |
|------|---|
| 0–2 | Protected by statute or physical necessity. Training hours cannot be automated. |
| 3–4 | Stable. Some junior tasks absorbed; the apprenticeship survives. |
| 5–6 | Visible narrowing. Employers prefer experience; junior intake reduced. |
| 7–8 | Substantial. The work juniors learned on has largely gone. |
| 9–10 | The training layer and the automatable layer were the same layer. |

Physical / embodied (P) — *must this be done in person, with a body, in an unpredictable setting?*

RATING	ANCHOR
--------	--------

- | | |
|------|--|
| 0–2 | Fully screen-based. Location-independent. |
| 3–4 | Occasional presence; the core work is not physical. |
| 5–6 | Regular physical presence, in largely controlled conditions. |
| 7–8 | Substantially physical, with some variability of setting. |
| 9–10 | Irreducibly physical, in conditions that differ every time. |

Human trust / accountability (T) — *does someone need a specific human they can rely on, and must a human answer when it goes wrong?*

RATING	ANCHOR
0–2	Output is anonymous and reviewed by others.
3–4	Work is signed off by someone else. No personal reliance.
5–6	Some client relationship; accountability is institutional.
7–8	Named responsibility, with commercial or professional consequence.
9–10	The relationship is the service, and liability attaches personally.

Regulatory / licensing (R) — *does the law reserve this act to a qualified human?*

RATING	ANCHOR
0–2	No license exists and none is proposed.
3–4	Certification is customary but not reserved.
5–6	Partial reservation, varying by jurisdiction or task.
7–8	Licensed practice, with some unreserved adjacent work.
9–10	Comprehensive statutory reservation, including of the training route.

Judgment under novelty (J) — *how often does the work present something with no matching precedent, where being wrong is costly?*

RATING	ANCHOR
0–2	Routine by design. Deviation is an error, not a case.
3–4	Occasional exceptions, handled by escalation.
5–6	Regular non-standard cases within a known range.
7–8	Frequent genuine novelty with material consequences.
9–10	Novelty is constant, and in some fields adversarially generated.

3. Factor ratings by track

Ratings are the Fall 2026 edition unless a range is shown. **P, T, R and J are held constant across editions** — those protections are structural and do not move on a three-year horizon. All measured movement is in A and E.

INVESTIGATIVE REPORTING — 5.1 (MODERATE)

FACTOR	WEIGHT	2023	2025	2026	CONTRIBUTION TO 2026 SCORE
Task automatability	35%	4.9	5.5	6.1	2.13
Entry-path erosion	15%	6.5	7.0	7.5	1.12
Physical / embodied	15%	6.0	6.0	6.0	0.6
Human trust / accountability	15%	8.5	8.5	8.5	0.22
Regulatory / licensing	10%	1.0	1.0	1.0	0.9
Judgment under novelty	10%	9.0	9.0	9.0	0.1
				Total	5.08 → 5.1

SPECIALIST / TRADE REPORTING — 5.8 (MODERATE-HIGH)

FACTOR	WEIGHT	2023	2025	2026	CONTRIBUTION TO 2026 SCORE
Task automatability	35%	5.4	6.1	6.8	2.38
Entry-path erosion	15%	7.0	7.4	7.8	1.17
Physical / embodied	15%	4.5	4.5	4.5	0.82
Human trust / accountability	15%	7.5	7.5	7.5	0.38
Regulatory / licensing	10%	1.0	1.0	1.0	0.9
Judgment under novelty	10%	8.5	8.5	8.5	0.15
				Total	5.8 → 5.8

DATA JOURNALISM — 6.5 (MODERATE-HIGH)

FACTOR	WEIGHT	2023	2025	2026	CONTRIBUTION TO 2026 SCORE
Task automatability	35%	5.2	6.2	7.1	2.48
Entry-path erosion	15%	7.2	7.6	8.0	1.2
Physical / embodied	15%	2.5	2.5	2.5	1.12
Human trust / accountability	15%	6.5	6.5	6.5	0.53
Regulatory / licensing	10%	1.0	1.0	1.0	0.9
Judgment under novelty	10%	7.5	7.5	7.5	0.25
				Total	6.49 → 6.5

GENERAL NEWS REPORTING — 6.7 (MODERATE-HIGH)

FACTOR	WEIGHT	2023	2025	2026	CONTRIBUTION TO 2026 SCORE
Task automatability	35%	6.0	7.0	7.7	2.69
Entry-path erosion	15%	7.5	7.9	8.3	1.25
Physical / embodied	15%	3.5	3.5	3.5	0.97
Human trust / accountability	15%	6.0	6.0	6.0	0.6
Regulatory / licensing	10%	1.0	1.0	1.0	0.9
Judgment under novelty	10%	7.0	7.0	7.0	0.3
				Total	6.71 → 6.7

DESK / AGGREGATION & REWRITE — 8.3 (HIGH)

FACTOR	WEIGHT	2023	2025	2026	CONTRIBUTION TO 2026 SCORE
Task automatability	35%	5.5	7.6	8.8	3.08
Entry-path erosion	15%	8.0	8.5	9.0	1.35
Physical / embodied	15%	1.0	1.0	1.0	1.35
Human trust / accountability	15%	3.5	3.5	3.5	0.97
Regulatory / licensing	10%	1.0	1.0	1.0	0.9
Judgment under novelty	10%	3.5	3.5	3.5	0.65
				Total	8.3 → 8.3

4. Backcast arithmetic

Worked example for the headline track, showing exactly how the three-year movement is composed.

Investigative reporting

EDITION	A	E	PROTECTION DEFICIT (FIXED)	SCORE
2023	4.9	6.5	1.83	4.5
2025	5.5	7.0	1.83	4.8
Fall 2026	6.1	7.5	1.83	5.1

Movement decomposition: automatability contributed +0.42 and entry-path erosion +0.15, for a total of +0.6 points over three years.

The 2023 and 2025 figures are retrospective reconstructions using the current methodology, not archived scores from published editions. They are our best assessment of what each factor would have rated at the time, given what was then demonstrable. They are not measurements.

5. Sensitivity

How far the score moves if a single factor is rated one point differently:

FACTOR	±1 POINT MOVES THE SCORE BY
Task automatability	±0.35
Entry-path erosion	±0.15
Physical / embodied	±0.15
Human trust / accountability	±0.15
Regulatory / licensing	±0.10
Judgment under novelty	±0.10

What this means in practice. A one-point disagreement about automatability moves a score by 0.35 — enough to shift a track between bands at the margins. A one-point disagreement about licensing moves it by 0.10, which almost never changes a band.

So if you disagree with one of our numbers, the automatability rating is where the disagreement matters most, and it is the rating we would most want challenged.

6. Stated limitations

We measure capability, not deployment. Scores reflect exposure to what AI can already do at the leading edge — not how much any particular employer has adopted. Adoption lags capability by years and lags unevenly: large, well-funded organisations first; small, rural, public-sector and thin-margin employers much later. The lag is a buffer, not a shelter. It buys time without changing direction.

We do not measure demand. A task can be highly automatable and highly in demand simultaneously. Where the labor market and our framework disagree, we say so in the profile rather than adjusting the score to fit.

We do not measure oversupply. The number of people entering a field is outside our six factors, and for some careers it matters more than automation.

We do not measure industry economics. A profession can contract for reasons entirely unrelated to technology.

We do not measure whether the work is worth doing. Pay, satisfaction, debt, hours and meaning sit outside the score and are covered separately in each profile — often at greater length, because for several careers they matter more.

Sub-track definitions are ours. Job titles vary between employers and countries. We have chosen tracks that reflect genuinely different work, not official classifications.

7. What would change our mind

Each edition names specific, checkable indicators. If these move, the scores move — including downward.

Across the index:

- **Graduate hiring share.** If employers in the professions where we rate entry-path erosion highly return to hiring juniors at pre-2023 rates, those ratings fall.
- **Content of mandated training hours.** Several professions protect their on-ramp through required supervised experience. If the content of those hours shifts from producing work to supervising it, the protection weakens without any rule changing.
- **Offsite and prefabricated construction share.** The clearest test of our physical-protection ratings: automation performs well in controlled settings, so moving work indoors raises exposure without any robotics breakthrough.
- **Verified deployment rather than capability.** If adoption stalls materially below capability for several editions, our leading-indicator approach is overstating near-term risk and we will say so.

We will report movement in either direction. A framework that only ever revises upward is not measuring anything.

Scores measure exposure to what AI can already do — not how much any particular employer has deployed. The 2023 and 2025 figures are retrospective reconstructions using the current methodology.
