

Is a Marketing Degree Worth It in the AI Era? The 2026 Risk Score

The free sampler — the score by track, the six factors in brief, and the honest reasons to think twice. The complete profile goes deeper.

8.2

AI EXPOSURE · CONTENT & SOCIAL EXECUTION
where 10 is most at risk

Re-scored every six months. We publish where we might be wrong.

Quick answer: Content and campaign execution scores **8.2 out of 10** for AI exposure, where 10 is most at risk — among the highest scores in this index. Brand strategy and marketing leadership scores **5.5**. Marketing has no licensing protection, no physical requirement, and no structural moat of any kind. Every bit of protection in this field has to be earned, and all of it sits at the senior end.

The short answer for parents: not on its own. A general marketing degree pointed at a content or campaign execution job is one of the weakest combinations we score. The versions that work pair marketing with genuine analytical depth, with a specific industry, or point explicitly at commercial leadership.

Marketing AI risk score by track

Every career in this index is scored 1–10, where **10 is most exposed** to AI. Same six factors, same weights, applied identically to a marketer and a paramedic.

TRACK	2023	2025	FALL 2026	3-YR MOVE	BAND
Brand strategy / marketing leadership	4.7	5.0	5.5	+0.8	Moderate
Marketing science / analytics	5.4	5.8	6.2	+0.8	Moderate–High
Product marketing	5.6	6.0	6.5	+0.9	Moderate–High
Campaign management	6.2	6.8	7.2	+1.0	High
Content & social execution	6.5	7.6	8.2	+1.7	High

2023 and 2025 figures are reconstructed using current methodology, not archived from past editions.

How that compares: the median career in this edition scores around 5.5. A business analyst scores **7.6**. Entry-level software development scores **8.1**. Bedside nursing scores **2.8**.

Content execution moved +1.7 in three years — third-fastest in the entire index. And it started from an already elevated base.

Will AI replace marketers?

It has already replaced most of what a junior marketer was hired to do.

AI IS TAKING	IT CAN'T TOUCH
Copywriting and content production	Deciding what the brand should mean
Social posts and campaign variants	Reading a market that has changed
Email sequences and landing pages	Taking a creative risk a model wouldn't
SEO article production	Owning the number when the campaign fails
Basic design and asset resizing	Persuading a board to fund something unproven
Performance reporting and dashboards	Judgment about what is worth measuring

The distinction that matters is between *producing* marketing and *deciding* marketing. Generating content is no longer a job — it is a prompt. Deciding what should exist, and being accountable for whether it worked, still is.

Why does marketing score so high? The six factors

How content and campaign execution rates against each. Ratings are 0–10 on each factor's own terms.

FACTOR	RATING	EFFECT ON RISK
How much of this job can AI already do?	8.6	↑ severe exposure
How hard will it be to land that first job?	8.0	↑ severe exposure
Does it have to be done in person, with your hands?	1.0	↓ none
Does someone need a human they can trust and hold responsible?	3.0	↓ almost none
Does the law require a licensed human?	1.0	↓ none
How often does the job hit genuinely new, high-stakes situations?	3.0	↓ almost none

ONE FACTOR, WORKED THROUGH IN FULL

So you can see what the analysis actually looks like — and what a rating of 1.0 means.

Does the law require a licensed human? — rated 1.0, and why the zeros matter more than the high numbers

Most of our worked examples explain why a career is protected. Marketing is worth examining for the opposite reason: it is the clearest case in this index of a profession with **no structural protection at all**, and understanding what that means is more useful than another example of a strong score.

Two of our six factors are effectively zero for everyone in marketing, at every level of seniority:

Regulatory protection: 1.0. There is no license. No professional body controls entry, no statute reserves any marketing activity to a qualified human, and nothing prevents any organization from replacing marketing work with software the moment the software is adequate. Compare accounting, where the audit signature is a legal monopoly, or nursing, where scope-of-practice rules and staffing ratios are written into law.

Physical requirement: 1.0. All of it can be done from anywhere, which means all of it can be done by anything.

Those two zeros are permanent and they apply to the CMO as much as to the intern. Nothing anyone does changes them.

So marketing's entire protection budget has to come from the remaining factors — trust, judgment and accountability — and all three are seniority-dependent. A brand director rates 7.0 on trust because clients and boards want a human answerable for the strategy. A content executive rates 3.0 because nobody is trusting them with anything.

That is why the gap between the top and bottom of this profession is 2.7 points, and why the bottom is the highest score in the business family.

The general lesson: look at what a profession has at zero. Careers with structural protections have a floor beneath them, however junior. Careers without one have only whatever the individual has personally earned — and a graduate has not earned anything yet.

Which marketing careers are safest from AI?

Ranked by exposure, safest first:

1. **Brand strategy / leadership** — 5.5. Commercial accountability and long-horizon judgment. 2. **Marketing science / analytics** — 6.2. Real quantitative depth is scarcer than content skill. 3. **Product marketing** — 6.5. Sits close to the product and the customer, with genuine domain knowledge. 4. **Campaign management** — 7.2. Coordination and execution, heavily automatable. 5. **Content & social execution** — 8.2. The most exposed track in the business family.

Is a marketing degree still worth it in 2026?

Only in specific forms, and the general version is the problem.

A broad marketing degree aimed at a content or campaign job is what a large share of marketing students are actually enrolled in, and it is the combination our scoring likes least — high automatability, severe entry-path erosion, and no structural protection to slow either down.

The versions that hold up:

- **Marketing paired with genuine analytical depth** — marketing science, econometrics, experimentation. The people building the models are scarcer than the people running them.
- **Marketing paired with a domain** — healthcare, financial services, industrial. The domain knowledge is the protection, not the marketing.
- **Marketing treated as a route to commercial leadership**, where accountability for revenue is the thing that protects you.

The portfolio question matters more here than in any other field we score: **can the graduate demonstrate judgment and results, rather than volume of content?** Content volume is now free. Judgment is not.

Worth asking any program directly: what did last year's graduates get hired to do, and what were they doing three years later?

Common questions

Will AI replace marketers? It has already replaced most content production. Strategy, brand judgment and commercial accountability are holding, but they are senior functions that a graduate cannot start in.

Is marketing a dying career? No — but the entry tier is among the most automated work we score, and there is no structural protection slowing it down.

Is a marketing degree useless? Not useless, but weak on its own. Its value now depends almost entirely on what it is combined with — analytics, a domain, or a route into commercial leadership.

What marketing jobs are safest from AI? Brand strategy and marketing leadership at 5.5, followed by marketing analytics at 6.2. Both are protected by accountability rather than by anything structural.

Should my child study marketing or business? They score similarly at the exposed end — content execution 8.2 against business analyst 7.6 — and business has slightly better protected destinations. Neither has any structural moat. If the interest is genuinely in marketing, the analytics route is the defensible version.
